

Greenhouse Gas Assessment for Reed Global Limited and its subsidiary companies – UK offices

Assessment Period: July 2022 - June 2023

Produced on Nov. 29, 2023 By Our Impacts

#### **Assessment Details**

# This report is prepared on behalf of Climate Impact Partners for Reed Global Limited and its subsidiary companies – UK offices

Climate Impact Partners works with clients all over the world to develop carbon reduction strategies; including footprint measurement, establishing reduction targets and delivering carbon offset programmes.

#### **Consolidation Approach**

Operational Control

#### **Organisational Boundary**

Operations of Reed Global Limited and its subsidiary companies - UK offices

#### Included

- · Reed Global Limited and its subsidiary companies UK offices
- UK Offices

#### **Operational Boundary**

- · Air travel with RFI for CIP
- · Bus and coach
- Composted waste
- · Electricity
- · Electricity Green Tariff
- · Employee owned cars
- · Hotel night stays
- · Incinerated waste
- · Landfilled waste
- · Natural gas
- · R-22 Refrigerant gas
- Rail (train, tram, light rail, underground)
- · Recycled waste
- · Refrigerant gas loss and other fugitive emissions
- Taxi
- · Water supply
- Water treatment

#### **Client Contact**

TOTAL FOR OFFSET(tCO <sub>2</sub> e)*				2,178	3,153	

<sup>\*</sup> Please note total calculated GHG emissions are rounded up to the nearest whole tCO  $_{2}e$  for the purpose of offsetting. Rounding errors may apply.

#### Introduction

A greenhouse gas (GHG) emissions assessment quantifies the total greenhouse gases produced directly and indirectly from a business or organisation's activities. Also known as a carbon footprint, it is an essential tool, providing your business with a basis for understanding and managing its climate change impacts.

A GHG assessment quantifies all seven Kyoto greenhouse gases where applicable and is measured in units of carbon dioxide equivalence, or  $CO_2e^1$ . The seven Kyoto gases are carbon dioxide  $(CO_2)$ , methane  $(CH_4)$ , nitrous oxide  $(N_2O)$ , hydrofluorocarbons (HFCs), nitrogen trifluoride  $(NF_3)$ , sulphur hexafluoride  $(SF_6)$  and perfluorocarbons (PFCs). The global warming potential (GWP) of each gas is illustrated in the Table 1.

Table 1. GWP of Kyoto Gases (IPCC 2007)

Greenhouse Gas	GWP
Carbon dioxide (CO <sub>2</sub> )	1
Methane (CH <sub>4</sub> )	25
Nitrous oxide (N <sub>2</sub> O)	298
Hydrofluorocarbons (HFCs)	124 - 14,800
Perfluorocarbons (PFCs)	7,390 - 12,200
Nitrogen trifluoride (NF <sub>3</sub> )	17,200
Sulphur hexafluoride (SF <sub>6</sub> )	22,800

This assessment has been carried out in accordance with the World Business Council for Sustainable Development and World Resources Institute's (WBCSD/WRI) Greenhouse Gas Protocol; a Corporate Accounting and Reporting Standard, including the GHG Protocol Scope 2 Guidance. This protocol is considered current best practice for corporate or organisational greenhouse gas emissions reporting. GHG emissions have been reported by the three WBCSD/WRI Scopes.

Scope 1 includes direct GHG emissions from sources that are owned or controlled by the company such as natural gas combustion and company owned vehicles.

Scope 2 accounts for GHG emissions from the generation of purchased electricity, heat and steam generated off-site. As the subject of this assessment operates in markets which offer contractual instruments with product or supplier-specific data, scope 2 emissions are reported using both the location-based method and the market-based method. The location-based method applies average emission factors that correspond to the grid where consumption occurs, whereas the market-based method applies emission factors that correspond to energy purchased (or not purchased) through contractual instruments. Contractual instruments include energy attribute certificates, direct energy contracts, and supplier specific emission rates. The subject of this assessment has ensured that any contractual instruments used in the market-based method have met the Scope 2 Quality Criteria, as defined in the Guidance. Where contractual instruments do not meet the Quality Criteria, or where contractual instruments were not purchased, market-based scope 2 emissions have been calculated using residual mix emission factors. Where residual mix emission factors are not available, market-based scope 2 emissions have been calculated using default location grid-average emission factors, per the Protocol hierarchy. This may result in double counting between electricity consumers, as an adjusted emission factor taking into account voluntary purchases of electricity with specific attributes was not available.

Scope 3 includes all other indirect emissions such as waste disposal, business travel and staff commuting. Reporting of these activities is optional under the WBCSDWRI GHG Protocol, but as they can contribute a significant portion of overall emissions Ecometrica recommends they are reported where applicable.

A GHG assessment is an essential tool in the process of monitoring and reducing an organisation's climate change impact as it allows reduction targets to be set and action plans formulated. GHG assessment results can also allow organisations to be transparent about their climate change impacts through reporting of GHG emissions to customers, shareholders, employees and other stakeholders. Regular assessments allow clients to track their progress in achieving reductions over time and provide evidence to support green claims in external marketing initiatives such as product labelling or CSR reporting. Ecometrica GHG assessments are designed to be transparent, consistent and repeatable over time.

<sup>&</sup>lt;sup>1</sup> Carbon dioxide equivalent or CO<sub>2</sub>e is a term for describing different greenhouse gases in a common unit. For any quantity and type of greenhouse gas, CO<sub>2</sub>e signifies the amount of CO<sub>2</sub> which would have the equivalent global warming impact.

# **Data Quality and Availability**

In order to provide the most accurate estimate of an organisation's GHG emissions, primary (actual) data should be used where it is available, up to date and geographically relevant. Secondary data in the form of estimates, extrapolations and industry averages may be used when primary data is not available. Table 2 details the quality of data submitted for this assessment with the key assumptions used stated below.

#### **Data Quality Overview**

Location-based

### **Key Assumptions**

#### **Premises**

- Electricity emissions have been calculated using the spend-based approach. In which the annual amount spent on electricity and the BEIS (2023) average electricity spend per kWh for a small/medium consumer are used to obtain an emissions summary.
- Natural gas consumption has followed a similar procedure, where the amount spent and the BEIS (2022) average natural gas price per kWh is used to calculate emissions.
- Actual water supply data was provided for the subsidiary company, Reed Online. For the remaining companies, Reed Specialist
  Recruitment and Reed in Partnership, the water supply was estimated based on FTE and the BBP (2018) assumption for office water
  intensity (typical practice). Water treated has been assumed to be equal to water supplied.
- Waste was estimated for Reed Online only, using the floor area of the office. Actual data was supplied for the other subsidiary companies.

#### **Business Travel**

- Business travel by train, underground, and tram has been estimated based on the amount spent and the DFT (2022) average cost per <a href="mailto:pass.km">pass.km</a> for travel by train, underground, and tram.
- Business travel by local bus has been estimated based on the amount spent and the DFT/TFS (2023) average cost per pass.km for travel by local bus.
- Business travel by taxi has been estimated based on the amount spent and the DFT (2003) average cost per pass.km for travel by taxi
- Emissions associated with hotel night stays have also been captured within this assessment. The amount spent and the Business Travel News (2022) average cost per night is used to calculate emissions.
- A Radiative Forcing Index (RFI) of 1.6 was used for air travel to account for the more severe global warming effects that emissions have when released at higher altitudes.

# Assessment Summary for Reed Global Limited and its subsidiary companies – UK offices

# Gross Overall Emissions (location-based): 2,178 tCO<sub>2</sub>e Gross Overall Emissions (market-based): 3,152 tCO<sub>2</sub>e

#### **Key Performance Indicators**

Absolute GHG emissions will vary over time and often correspond to the expansion or contraction of an organisation. It is useful therefore to use reporting metrics that take these effects into account and monitor relative GHG emissions intensity. A common emissions intensity metric is tonnes of CO<sub>2</sub>e per full time equivalent. This has been calculated, along with other relevant metrics, in the table below:

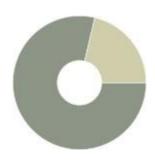

Data	KPI
4,182 Full Time Equivalent Employees	0.521 tCO <sub>2</sub> e per Full Time Equivalent Employee (Location-Based)
4,182 Full Time Equivalent Employees	0.754 tCO <sub>2</sub> e per Full Time Equivalent Employee (Market-Based)

#### Summary by Activity (Location-Based, tCO2e)

Ву	/ Activity		tCO <sub>2</sub> e/year	%
	Premises		1,506	69.2
	Business Travel		672	30.8
		Total	2,178	100

#### Summary by Activity (Market-Based, tCO<sub>2</sub>e)

В	y Activity	tCO <sub>2</sub> e/year	%
	Premises	2,481	78.7
	Business Travel	672	21.3
	Total	3,152	100

Summary by WBCSD/WRI Scope (Location-Based, tCO2e)

By Activity		tCO <sub>2</sub> e/year	%
Scope 1		285	13.1
Scope 2		1,098	50.4
Scope 3		795	36.5

# Summary of Scope 2 Market-Based Method for Reed Global Limited and its subsidiary companies – UK offices

Energy Consumed and Emissions By Factor Type In Scope 2 Market-Based Method

Scope 2 Market-Based Energy

Scope 2 Market-Based Emissions

Emission Factor Type	Ene	rgy	Market-Based Emissions		
,	MWh	%	tCO <sub>2</sub> e	%	
Client-supplied market-based instrument	0	0	0	0	
Residual mix factors	5,676	100	2,072	100	
Default location-based factors	0	0	0	0	
Total	5,676	100	2,072	100	

**Note:** At least one scope 2 answer was entered into the Platform as direct emissions, which were calculated outside the Platform. Raw data - including energy consumption - is therefore unavailable and the Scope 2 Method used to calculate these emissions is unknown. Throughout this report, it has been assumed that direct emissions were calculated via the location-based method, and that the location-based default methodology was used for the market-based method. Total consumption in MWh shown in the above table does not include consumption for any direct emission answers, since this data was not provided.

## **Key Observations**

#### Overall

- No market-based instruments have been applied. Reed Global Limited and its subsidiary companies UK offices are located in the United Kingdom, which has a valid electricity residual mix factor available. This residual mix factor has been applied to the electricity consumption to derive a result in line with the Scope 2 market-based methodology.
- Reed Global Limited and its subsidiary companies UK offices have chosen not to report or estimate employee commuting and homeworking due to inconsistencies in the data available, to ensure the accuracy of the report.

#### **Location-Based Methodology**

- Overall, location-based emissions have increased by 14.8% from the previous year's assessment. This increase is largely due to increased electricity consumption and air travel for business purposes.
- Electricity consumption makes up the largest source of emissions with 1098 tCO2e or 50.4% of gross company emissions.
- · Employee-owned cars for business travel are the second greatest contributor with 407 tCO2e, or 18.7% of company emissions.

#### Market-Based Methodology

- Market-based emissions have increased by 28.6% in comparison to the 2021/2022 assessment period. Again, this is mainly due to electricity consumption.
- The majority of emissions result from electricity consumption accounting for 65.7% of total emissions (2072 tCO2e).
- Employee-owned cars are the next biggest emissions source, with 407 tCO2e or 12.9% of company emissions.
